# Device-check record

A local record for a phone bought outside the US. Do not enter an IMEI. Use Verizon's official checker separately.

**Fictional teaching example**

| | | |
|---|---|---|
| **Marketing name** | Fictional Phone X | Do not stop at the marketing name |
| **Exact model number** | X-0000-IN | Settings or packaging |
| **Sales market** | India | Country of purchase |
| **Carrier lock** | Unverified | Locked, unlocked or unknown |
| **Network compatibility** | Not checked | Verizon's official checker |
| **SIM capability** | Physical SIM and eSIM | Exact model specification |
| **VoLTE support** | Unverified | Do not infer from 5G or LTE bands |
| **Official checker result** | Not run in this fictional example | Carrier result is separate from account approval |
| **Number task** | New US number | New number or port-in |
| **Account task** | Prepaid, document rule unverified | Separate from the device |
| **Missing facts** | Unlock status, model band variant, account document rule | Ask the carrier |
| **Next action** | Run Verizon's checker, then record the result | Do not buy a plan first |

The model and market are invented. A compatible device result would still not approve an account or a specific plan.
